

Domain Trusts

A domain trust is a relationship between two domains in Microsoft Active Directory that allows users in one domain to access resources in another domain. A domain trust relationship enables users to access resources located in a domain other than the domain in which they are authenticated.

Here are the steps to set up a domain trust in Active Directory:

1. Ensure that both domains are running at least Windows Server 2003 functional level or later.
2. Open the Active Directory Domains and Trusts snap-in on the domain that will be the trusting domain (the domain that will provide the trust).
3. Right-click the domain node in the tree view and select "Properties".
4. In the Properties window, select the "Trusts" tab.
5. Click the "New Trust" button to start the New Trust Wizard.
6. In the New Trust Wizard, select the "External Trust" option and click "Next".
7. On the "Trusted Domain" page, type the name of the domain you want to trust and click "Next".
8. On the "Trust Direction" page, select "Two-way" if you want to allow users from both domains to access resources in each other's domains, or select "One-way: Incoming" if you only want to allow users in the trusted domain to access resources in the trusting domain.
9. On the "Transitive Trust" page, select "Yes" if you want the trust to be transitive, meaning that if Domain A trusts Domain B and Domain B trusts Domain C, then Domain A trusts Domain C as well.
10. On the "Trust Password" page, type a password that will be used to establish the trust. This password will be used to confirm the identity of the trusted domain when the trust is established.
11. On the "Completing the New Trust Wizard" page, review the information and click "Next".
12. On the "Confirm Outgoing Trust" page, click "Yes" to confirm the creation of the outgoing trust.
13. On the "Confirm Incoming Trust" page, click "Yes" to confirm the creation of the incoming trust.
14. The trust relationship should now be established, and users in the trusted domain should be able to access resources in the trusting domain.
