

Enterprise vs Domain Admins

In Microsoft Active Directory, the "Domain Admins" and "Enterprise Admins" groups are two separate groups that have different levels of administrative control over the domain and forest, respectively.

1. Domain Admins: The "Domain Admins" group has administrative control over a single Active Directory domain. Members of this group have the ability to create and manage user accounts, manage group policies, and perform other administrative tasks within the domain. They can also delegate administrative control to other users or groups within the domain.
2. Enterprise Admins: The "Enterprise Admins" group has administrative control over the entire Active Directory forest. Members of this group have complete control over all domains within the forest, including the ability to create new domains and manage user accounts, group policies, and other administrative tasks. The Enterprise Admins group is at the top of the administrative hierarchy within an Active Directory forest, and its members have the highest level of administrative control.

It's important to note that membership in the Enterprise Admins group should be restricted to a small number of trusted individuals, as this group has the ability to make changes that could potentially affect the entire forest. Similarly, membership in the Domain Admins group should be restricted to a small number of trusted individuals who have a specific need to perform administrative tasks within the domain.
