

Q&As on Active Directory

1. Here are 10 basic questions and potential answers. What is Active Directory and how does it work?
 - Sample answer: Active Directory is a directory service used by Microsoft Windows Server to manage and authenticate users, computers, and resources on a network. It works by using a hierarchical structure of objects and attributes to store information about network resources, and provides authentication and authorization services to users and computers.
2. What is a domain controller and how does it work in Active Directory?
 - Sample answer: A domain controller is a server that stores and manages the Active Directory database, and provides authentication and authorization services to users and computers in a domain. It works by replicating the Active Directory database to other domain controllers in the domain, and providing authentication services using Kerberos or NTLM protocols.
3. How do you create a user account in Active Directory?
 - Sample answer: To create a user account in Active Directory, you can use the Active Directory Users and Computers console or PowerShell commands. You would typically specify the user's name, password, group membership, and other attributes such as email address or job title.
4. How do you manage group membership in Active Directory?
 - Sample answer: To manage group membership in Active Directory, you can use the Active Directory Users and Computers console or PowerShell commands. You would typically select the group you want to modify, and add or remove members as needed.
5. How do you troubleshoot Active Directory replication issues?
 - Sample answer: To troubleshoot replication issues in Active Directory, you can use the Active Directory Replication Status Tool or PowerShell commands. You would typically check replication status between domain controllers, review event logs, and use diagnostic tools to identify and resolve any issues.
6. What are group policies and how do you use them in Active Directory?
 - Sample answer: Group policies are a set of settings and configurations that can be applied to users and computers in an Active Directory domain. You can use the Group Policy Management Console to create, edit, and manage group policies, and apply them to different organizational units or groups in the domain.
7. How do you manage Active Directory security settings?
 - Sample answer: To manage security settings in Active Directory, you can use the Group Policy Management Console or PowerShell commands. You would typically configure settings related to passwords, authentication, and authorization, and ensure that the appropriate permissions are set on objects and attributes in the directory.
8. How do you back up and restore Active Directory?

- Sample answer: To back up and restore Active Directory, you can use the Windows Server Backup feature or third-party backup solutions. You would typically back up the system state data on domain controllers, and restore it in the event of a disaster or data loss.

9. What are trusts in Active Directory and how do they work?

- Sample answer: A trust is a relationship between two domains in Active Directory that allows users and computers in one domain to access resources in the other domain. You can create different types of trusts, such as one-way or two-way trusts, and configure trust relationships using the Active Directory Domains and Trusts console.

10. How do you manage Active Directory permissions and access control?

- Sample answer: To manage permissions and access control in Active Directory, you can use the Active Directory Users and Computers console or PowerShell commands. You would typically configure permissions on objects and attributes in the directory, and use security groups to control access to resources.
